Managing Bowel Incontinence

What is bowel incontinence?
- Not being able to control a bowel movement from the rectum
- Bowel incontinence has many causes. Some of these include:
  - Weakness of the anal muscle
  - Dementia or mobility related
  - Nervous system disorders
  - Mental confusion
- Other factors include:
  - Long-term use of laxatives
  - Not enough fluid intake
  - Lack of exercise
  - Hemorrhoids
  - Sedation
  - Very hard stool
- Severe constipation may lead to leakage from the rectum

What are the signs and symptoms?
- Losing control of a bowel movement
- Blockage of bowel contents. Symptoms may include:
  - Nonstop oozing of loose stools
  - Loss of appetite
  - Cramping

What to report to the hospice/palliative care team?
- Color, looseness and odor of the stool
- Abdominal discomfort, cramping or bloating
- Medications and diet history
- Changes in activity level
- Skin problems of the affected area
- Patient and caregiver’s thoughts
What can be done for bowel incontinence?

- Know the person’s bowel history. Know the usual routine. Time of day, following a meal, etc.
- Plan a bowel retraining program that is easy and fits into the person’s lifestyle – your nurse can help with this
- Take in enough fluids and fiber if possible
- Provide ample time and privacy during toileting
- Keep skin clean and dry to prevent break down and odors. Avoid baby powder and cornstarch – use protective barrier creams
- Wear loose fitting clothing to allow for air flow
- Control odors with fresh air and room deodorizers
- Wear protective garments
- Avoid foods that act as laxatives. These include caffeine, alcohol, diet soda or artificial sweeteners
- Talk to your nurse for additional information
